ENHANCEU-T, A NON-NANOMETRIC INORGANIC SUNSCREEN.

ENHANCEU-T, A NON-NANOMETRIC INORGANIC SUNSCREEN

ADParticles has developed EnhanceU-T, an inorganic composite with properties suitable for use as UV filter in cosmetic. The particle-size distribution of EnhanceU-T is not in the nanometer range (1-100 nm) and it provides a high level of UVA and UVB protection.

EnhanceU-T consists of a composite of TiO_2 and SiO_2 , developed by ADParticles patented technology, providing broadband UV protection and offering safety and efficacy to the final formula.

The particle size distribution was determined by Nanoparticle Tracking Analysis (NTA) a characterization technique that utilizes the properties of both light scattering and Brownian motion in order to obtain the particle number size distribution of samples.

COMPOSITION

COMPOSITION

INCI:

- Titanium Dioxide
- Silica

TiO₂ Content		94-96%
SiO₂ Content		4-6%
	As % (m)	< 0.0001
	Sb % (m)	< 0.0002
	Pb % (m)	< 0.001
	Hg % (m)	< 0.0001

UV ABSORPTION SPECTRUM. PHOTOSTABILITY

UV ABSORPTION SPECTRUM. PHOTOSTABILITY

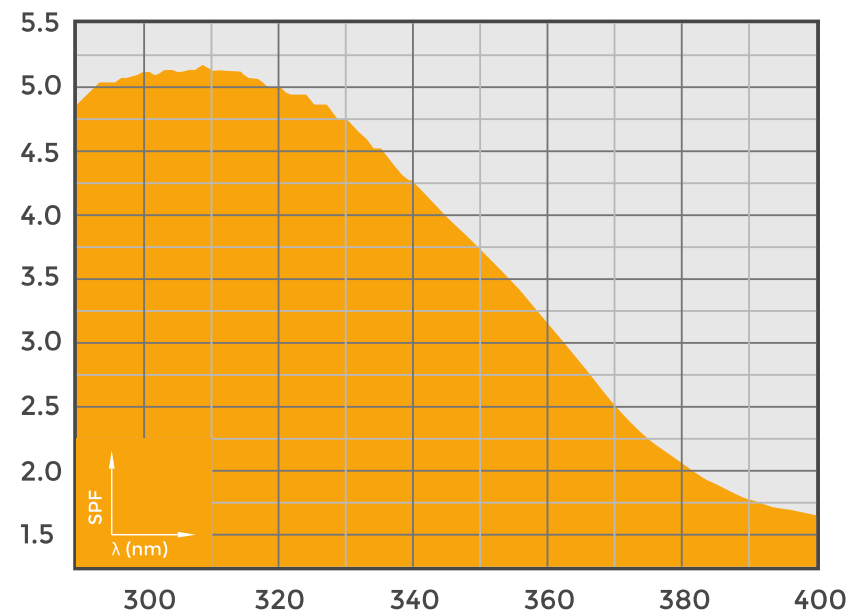

- **SPF:** 7,2
- **UVA PF:** 4,3
- **Ratio UVAPF/SPF:** 0,6
- **Ratio UVA/UVB:** 0,7
- **Critical wavelength:** 383 nm

The analysis was performed with a **Sun simulator Solar Oriel 300W** with a Xenon lamp (Newport, Cleveland, USA).

The filter concentration in the final formula was **5% (w/w)**

Photostability test was performed to evaluate the **SPF** both before and after irradiation of the sample with UV light, after **11 irradiation sessions of 1 minute**.

The photostability value is higher than **80%**, the refore **EnhanceU-T is considered to be photostable** (Garolietal. J. Dermatol. Sci. 52 (3), 193-204).
